Types of Bird Colouration

Bird coloration can be attributed mainly to two factors: pigments and structural coloration.

1. **Pigments:** These are chemicals that absorb certain wavelengths of light and reflect others, resulting in color. Common pigments include melanins (browns and blacks), carotenoids (reds, oranges, yellows), and porphyrins (greens and reds).
2. **Structural Coloration:** This occurs when microscopic structures in feathers scatter and reflect light to produce iridescent or shimmering colors, such as blues and greens, which pigments alone cannot create.

Understanding this scientific background adds a new dimension to the traditional “how the birds got their colours” text, showing how nature’s artistry is both biological and evolutionary.

Evolutionary Reasons for Colorful Plumage

Bird colors serve many purposes:

1. **Camouflage:** Blending in with their environment to evade predators.
2. **Mating Displays:** Bright colors often attract mates and signal fitness.
3. **Species Identification:** Helping birds recognize members of their own kind.
4. **Warning Signals:** Some birds use colors to warn predators of toxicity or to startle threats.

These functions highlight the practical reasons behind the beautiful colors that stories so poetically attribute to magical or divine intervention.
