Introduction to Blood Physiology

Blood is a vital connective tissue that performs essential functions in the human body. It transports oxygen, nutrients, hormones, and waste products, helps regulate body temperature and pH, and provides defense against infections. Understanding blood physiology involves exploring its composition, functions, and the mechanisms that regulate its components.

Components of Blood

Blood is composed of several key components, each with specific functions:

1. Plasma

- Constitutes about 55% of blood volume - Composed mainly of water (about 90%) - Contains dissolved nutrients, electrolytes, hormones, waste products, and plasma proteins (e.g., albumin, globulins, fibrinogen)

2. Formed Elements

- Red Blood Cells (Erythrocytes) - White Blood Cells (Leukocytes) - Platelets (Thrombocytes)

Functions of Blood

Blood performs multiple critical functions, including: - Transportation: Carries oxygen from lungs to tissues and carbon dioxide from tissues to lungs; transports nutrients, hormones, and waste products. - Regulation: Maintains pH balance, temperature, and fluid volume. - Protection: Contains immune cells and antibodies to defend against pathogens; facilitates clotting to prevent blood loss.
