Introduction to the Respiratory System

The respiratory system is fundamental to sustaining life by enabling gas exchange—absorbing oxygen into the blood and expelling carbon dioxide. Chapter 9 delves into the anatomical structures, physiological processes, and medical terminology associated with this vital system. Understanding this chapter equips learners with the vocabulary necessary to interpret clinical data, document patient encounters accurately, and understand disease processes.

Anatomy of the Respiratory System

Upper Respiratory Tract

The upper respiratory tract includes structures located above the larynx, primarily responsible for filtering, warming, and humidifying inhaled air.

1. Nasal Cavity: Contains mucous membranes and hair (vibrissae) that trap particles.
2. Sinuses: Air-filled cavities (frontal, ethmoid, maxillary, sphenoid) that lighten the skull and aid in voice resonance.
3. Pharynx: The throat area, connecting nasal cavity and mouth to the larynx and esophagus.

4. Larynx: The voice box, involved in phonation and protecting the trachea during swallowing.

Lower Respiratory Tract

Structures below the larynx involved in the conduction and gas exchange process.

1. Trachea: The windpipe that directs air toward the bronchi.
2. Bronchi and Bronchioles: Branching airways that distribute air to the lungs.
3. Lungs: Paired organs where gas exchange occurs.
4. Alveoli: Tiny air sacs within the lungs where oxygen and carbon dioxide are exchanged with the blood.

Physiology of the Respiratory System

The respiratory process involves several key functions:

1. Ventilation: The mechanical process of breathing—air moving in and out of the lungs.
